

SkyOps - operator guide

For Artur. Everything you need to run the platform in front of people. Nothing to install: open <https://getskyops.com/app> in any browser, on a laptop or a phone. It is always on.

1. What you are looking at

The screen has two halves.

The map (right). Rzeszow-Jasionka airport. Three arrows are the drones: SKY-01, SKY-02, SKY-03. A blue arrow is the one you selected. Lines behind an arrow are where it has flown. Green dashed lines are the route it was given.

The panel (left), five sections top to bottom:

SECTION	WHAT IT IS
Fleet	One card per drone: altitude, speed, battery, what it is doing
Mission Planner	Where you give drones somewhere to fly
Camera - AI Detection	Live video with the AI marking what it sees
No-Fly Zones	Areas the drones are forbidden to enter
Flight Logs	Every finished flight, with PDF reports

Top right: **Share view** copies a read-only link you can give anyone. They see the same live map but cannot touch the controls. Good for handing to a judge or a journalist on their own phone.

2. Fly one drone (the basic move)

1. Click a drone card, for example **SKY-01**. It turns blue on the map.
2. Press **Plan mission**.
3. Click 3 or 4 places on the map. Each click drops a waypoint.
4. Press **Launch**.

The drone takes off, climbs to 50 m, flies the route, and comes home. While it flies you can press:

- **Hold** - stops and hovers where it is
- **Resume** - continues the route
- **Return home** - abandons the route and flies back to base

Battery drains while flying. Below 25 percent the drone returns home by itself, without anyone pressing anything. Say this out loud when it happens, it is the kind of detail that makes people trust the system.

3. Send the whole fleet to search an area (the impressive move)

This is the one to show first. It is what nobody else at the table has.

1. Press **Search area**.
2. Click around the map to draw a shape - a village, a forest, a river

bend. Four or five clicks is enough.

1. Press **Launch fleet**.

The platform cuts the area into parallel strips, gives each drone its own strips, and they all launch together. Three drones cover the ground about three times faster than one.

What to say: *"I draw where the people are missing. The system divides the area between the drones by itself. The operator does not plan anything by hand."*

4. The AI camera

In **Camera - AI Detection** there are three buttons:

- **Search** - finds people, cars, boats. For missing persons.
- **Fire** - finds fire and smoke. For forest and building fires.
- **Flood** - measures how much of the ground is under water, as a

percentage.

Press one and wait about 5 seconds for the video to change. Boxes and labels appear on what the AI recognises. Every detection also becomes a line in the alert list underneath, with the time and the GPS position.

Careful with the honest wording: the AI **suggests**, the operator **decides**. Never say it is certain. The reports say the same thing in writing.

5. No-fly zones

1. Press **Draw zone**, click a few points around an area, press **Save**.
2. Now try to plan a mission into that zone - the platform refuses it.
3. If a drone is already flying and enters a zone, it turns around on

its own.

This is the answer to any question about safety, regulations or flying near an airport.

6. The paperwork (this wins the judges)

Open **Flight Logs**. Each finished flight has three links:

- **Replay** - the flight plays back on the map at 8x speed

- **PDF** - the flight report: route, altitude, battery, detections
- **Sitrep** - the Situation Report, in English and Polish

The Sitrep is the important one. It is one page: what was found, at what time, at which coordinates, a sketch of the route with red dots where the AI saw something, and a SHA-256 checksum at the bottom.

What to say: *"The commander does not get a hard drive of video. He gets one page he can act on. The checksum proves the document was not edited afterwards."*

Print two or three Sitreps on paper before the event and hand them out. Paper in the hand beats any slide.

7. The fire swarm (concept demo)

This one is a **vision**, not a product, and you must say so out loud. It answers the question "does this still work with a real fleet?"

1. Open **Fire Swarm** in the panel. It is marked "concept".
2. Press **Place fire**, then click anywhere on the map. A red dot

appears - that is the seat of a wildfire.

1. Choose 50, 100 or 200 drones.
2. Press **Deploy swarm**.

A forward base appears. The aircraft launch in waves, fly to the fire front, make a drop run, return to base, refill and go again. The fire spreads on its own while they work, so at the start it is winning.

Watch the big number: **containment**. It climbs as the swarm gets on top of the fire. Underneath you get area burning in hectares, number of drops, and tonnes of water delivered.

The strongest move: run it once with 50 drones and once with 200. With 50 the fire takes about five minutes to contain; with 200 it takes about three. That difference is the whole argument for a swarm, and you can show it rather than claim it.

What to say: *"Nobody flies two hundred firefighting drones today. But if somebody does, this is the screen they will need - and our control layer already handles it. Three aircraft or two hundred, the operator sees the same picture and one number that matters: how much of the fire is contained."*

What NOT to say: never suggest this fleet exists, is ordered, or is ours. It is a simulation and the word "concept" is printed on the panel for a reason.

8. Your 5-minute demo, in order

1. Open the dashboard. Let them look at it for a few seconds.
2. **Search area** - draw a shape, launch the fleet. Talk while they fly.
3. Switch the camera to **Fire**. Point at the boxes as they appear.
4. Point at an alert appearing in the list with its time and GPS.
5. Open **Flight Logs**, open a **Sitrep**, hand over the printed copy.
6. If they are still interested: **Fire Swarm**, 200 drones, and say

clearly that this part is a concept.

1. Press **Share view**, give someone the link, let them open it on their own phone.

Step 7 is the moment people believe it is real. Do not skip it.

9. If something breaks while you are presenting

Nothing moves / "connecting..." in the corner. The internet died. Reload the page. If that fails, switch to the laptop copy - it runs without any internet at all.

Camera panel says "camera offline". The AI needs about 15 seconds after a restart. Keep talking, it comes back. If it does not, move to the map and the reports - the demo still works without video.

A drone is stuck. Press **Return home**, then plan a new mission.

Everything is broken. Press **Auto demo: off** so it says **on**. The platform then flies patrols by itself with no input from you, and you can talk over it.

If you cannot fix it in 20 seconds, stop touching it and talk about the printed Sitrep instead. Never apologise twice for the same problem.

10. Hard questions, honest answers

"Does it fly real drones?" Yes - the connector for PX4 aircraft is built, and the same screen commands a real drone. What you see now is our simulator, because we demo indoors. Do not claim more than that.

"Is it connected to PansaUTM?" No. The check-in flow is simulated end to end so you can see how it would work. The real integration is the first item on our roadmap.

"How big is your team?" Two. My technical partner stays behind the scenes, I handle business and presentation.

"Can it shoot down drones?" No. We build the picture and the decision layer - what is in the air, where, and the evidence afterwards. Effectors are somebody else's business and somebody else's licence.

"Who has bought it?" Nobody yet. We are here to find the first pilot deployment. Say this plainly - everyone in that room can smell an invented customer.

11. The one rule

Everything in sections 2 to 6 works today and you can show it live. Anything beyond that - inter-agency systems, real airspace integration, court-grade evidence chains - is the **roadmap**, and you say the word "roadmap" out loud when you mention it.

We are a small team that shipped a working thing. That is a better story than a big team that shipped a slide.
